

a Paired observations and common agricultural support

b Multiscale target comparison

Aggregate square units
0.5, 1, 2, 5, 10, 20 and 30 km
Recompute S30 and L30 water fractions

↓

Compare ranks and selected targets
Rank agreement: Spearman ρ
Target agreement: top 20% overlap
Selected units: $k = \lceil 0.20 \times n \rceil$

Five event summary
Event means and bootstrap intervals

c County priority evaluation

Pool counts by county
Assign counties from 500 m cell centres
Water, valid, intersection and union counts

↓

AWC priority and county allocation
AWC = mean water fraction $\times$ Jaccard overlap
Exact budget: $0.20 \times n$ county equivalents
Equal sharing at cutoff ties

RMA indemnity capture and lift
Four events with positive RMA totals

d Sensitivity and scope checks			
Observation support	Water formulations	Within product stability	County utility
90%, 95%, 99%	DSWx, MNDWI, AWEI	Rank persistence Score dispersion	Budget / exposure Event sensitivity
